

Customer Response Library Builder

Catalog your top 20 customer questions and their approved answers — once. Then any AI tool can answer in your voice, accurately, every time. And your team and your channels stay coordinated.

From HitLai Institute — Module S2: “AI That Handles Your Customers”

WHY THIS EXISTS

Most businesses let every team member improvise customer responses. Three reps, three voices, three accuracy levels. AI doesn't fix that — it multiplies it. Feed a scattered knowledge base to ChatGPT and you get scattered answers at a faster rate.

A response library is 20 pre-approved answers to the 20 questions you get most often. Once it exists, any AI model can match an incoming question and return your approved answer — in your voice, with your pricing, citing your policies, referencing your real process.

Estimated time to build this list: 2-3 hours. It's the single highest-leverage thing you can do before turning on any customer-facing AI.

STEP 1: MINE YOUR INBOX FOR THE REAL QUESTIONS

Don't guess what people ask. Look.

1. Open your customer-facing inbox (email, website chat, WhatsApp, whatever carries the most volume).
2. Pull the last 100 conversations.
3. For each one, write down the *question the customer was actually trying to answer* — not the subject line. “How much does it cost?” not “Pricing inquiry.”
4. Group duplicates. The top 20 will emerge quickly. Most businesses find 80% of inbound falls into 10-15 patterns.

Common buckets you'll likely find: - Pricing / what's included / discounts - Availability / timelines / turnaround - Process / what happens after I sign up - Compatibility / “does this work with X?” - Refund / cancellation / change policies - Support escalation / “I have a problem” - Company basics / hours / location / contact

STEP 2: WRITE THE APPROVED ANSWERS

For each question, draft the response YOU would write if you had all day. Not the rushed 2-line reply — the one you'd write if it was the most important customer of the year.

Quality criteria: - Accurate pricing (exact, not ranges, if possible) - Clear next step at the end - Your voice — read it aloud; if it sounds like a form letter, rewrite it - Under 150 words (longer answers get skimmed and misread) - Never promise what you can't deliver

Example — answering “How much does it cost?”:

Thanks for asking directly — I appreciate it. Our standard [offering] starts at \$[X] for [scope], which covers [2-3 specific items]. Most clients end up in the \$[Y]-\$[Z] range once we scope the full project, because [honest reason why range exists — complexity, integrations, whatever]. I don’t hide pricing or force you through a discovery call to get a number. If you want a real quote for YOUR situation, send me [2 specific pieces of info] and I’ll have a number in your inbox within [X hours].

That answer is honest, specific, and sounds human. That’s the bar.

STEP 3: THE CATALOG

Fill this in. Keep it in a shared doc your team can edit.

#	Question (customer’s language)	Approved answer (1-3 sentences or link to doc)	Last reviewed	Owner
1				
2				
3				
4				
5				
6				
7				
8				
9				
10				
11				
12				
13

20				

STEP 4: TEST IT TODAY WITH ANY AI TOOL

You don't need a platform to get value from this sheet immediately. Paste the whole catalog into Claude or ChatGPT with this prompt:

Below is my approved customer response library. When I paste a customer message, match it to the closest library entry and reply in my voice using that approved answer. If no entry matches, say "no match — draft from scratch" and ask me 1 clarifying question. Never invent pricing or policy details not in the library.

[paste your 20-row catalog]

Here's the customer message: [paste]

You now have a faster-than-you customer response drafter that uses *your* approved answers.

WHERE THIS STOPS WORKING

That prompt works for one conversation at a time. Reality:

- **Multi-channel:** the same customer might email, then WhatsApp, then use your web chat. ChatGPT has no memory across channels or sessions.
- **50+ inquiries/day:** copying and pasting every message becomes its own full-time job.
- **Routine vs exception:** every question — even "what are your hours?" — still needs your approval before send. You'd auto-handle 80% if you could trust the rest.
- **Team consistency:** three reps, three versions of the catalog, back to square one.
- **Wrong answers:** when AI hallucinates something *not* in your library, you don't catch it until the customer has already received it.

You're not really fighting the AI tool — you're fighting the gap between AI, your team, and the channels your customers actually use.

WHAT HITLAI ADDS — IN PLAIN ENGLISH

AI tools, your team, your systems — running together, safely.

When the library lives inside HitLai:

- **One library, one voice, every channel** (email, WhatsApp, web chat, Slack — works with what you already use)
- **Your team in the loop where it matters** — drafts route to whoever owns that customer or that question type, in the systems they already work in
- **Trust journey:** AI starts on "watch" or "suggest." When a question type has been answered correctly 20 times in a row, you choose to let AI handle it directly. When something's unfamiliar, it comes back to your team.

- **One record** — every response logged, every approval visible, so you can see in 5 minutes what AI handled this week and flag anything off
- **No integration ceiling** — if you use a channel or CRM we don't have a connector for, the platform builds it automatically in minutes, reviewed before it goes live

The library itself is still the work. You can't shortcut this step. The catalog you build today makes *any* AI tool 3x better immediately, and is the foundation of a coordinated team-and-AI customer response when you're ready.

Want live help auditing your inbox and building your first 20 answers? That's exactly what Module S2 does, in person, with your own data. → hitlai.net/institute
